An innervated, vascularized  
immunocompetent  
human tissue-engineered skin  
to model cutaneous neuro-inflammation

*Team « Immune-microenvironment interactions in health and disease » (C.G. Mueller)  
CNRS UPR3572 – I<sup>2</sup>CT: Immunologie, Immunopathologie et Chimie Thérapeutique  
Institut de Biologie Moléculaire et Cellulaire, Strasbourg*

Université

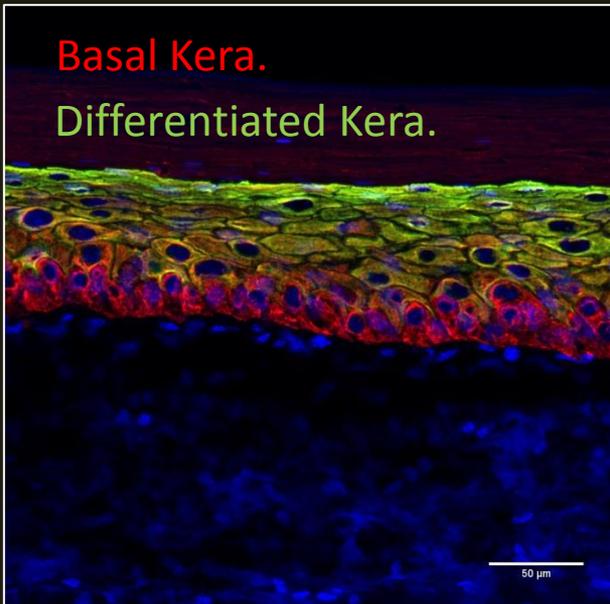

de Strasbourg

# 100% human Innervated, Vascularized immunocompetent Tissue-Engineered Skin = IV-iTES

**Readouts:** activation markers of immune cells (flow cytometry), production of neuropeptides and cytokines (ELISA), angiogenesis or neuronal growth (IHC)

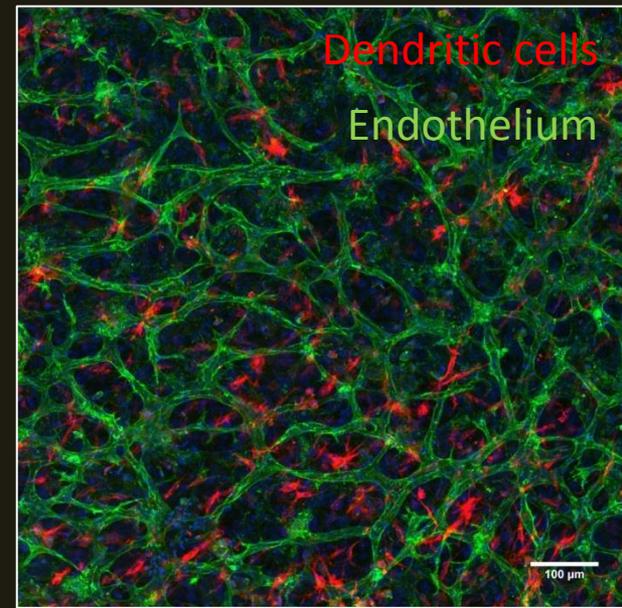

# Characterization of IV-iTES

Keratin 14

DAPI

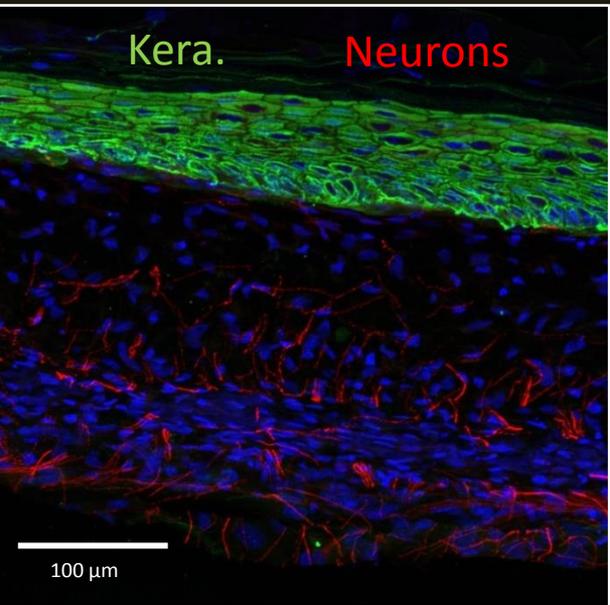

Keratin 10

HLA-DR

DAPI

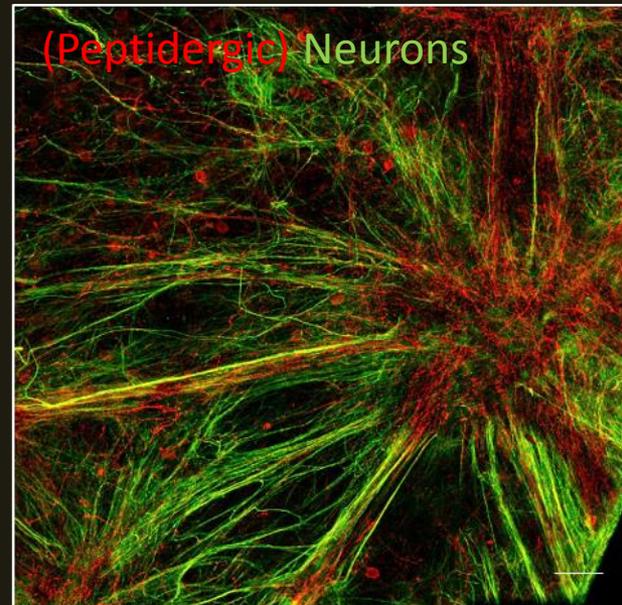

PECAM-1

$\beta$ 3 tubulin

DAPI

Keratin14

Substance P

Neurofilament H

# Our current goals

- Disease models (atopic dermatitis, psoriasis, acne inversa)
- Validation as non-animal sensitization model
- iP<sub>S</sub>-derived sensory neurons
- Miniaturisation
- Microfluidics
- In situ, real-time readouts for activation of immune system and sensory innervation

- Funding and support:
